Release Note

Fleekdrive Desktop Ver. 5.0.0　Feb. 27, 2021

Fleekdrive

Bug Fixes

No	Functions	Fixes
1	Bidirectional synchronizatio	After moving a synced folder on the local side of MacOS, editing the files in that folder causes a conflict.
2	Bidirectional synchronizatio	After renaming files in the synced folder, they will conflict on the next sync.
3	Bidirectional synchronizatio	If you delete a file or space in a specific space and then delete the parent space on your local PC, the contents will be empty but the parent space will remain.
4	Downlink synchronization	If the file is deleted on the Fleekdrive side during the downlink synchronization of the file update, the downlink synchronization of the deletion is not processed and the file remains locally.
5	Uplink synchronization	If you set a network drive as a sync folder and you add a file to that network drive after the first downlink sync is complete, the added file will not be synced up.
6	Uplink synchronization	Immediately renaming a newly created text file directly in the sync folder on the local PC fails to sync the file up
7	Update	Can't boot after Fleekdrive desktop update
