Bug Fixes

No	Functions	Fixes
1	Downlink synchronization	If you edit a text file on the server side and "overwrite" it, there may be a conflict on the client side.
2	Downlink synchronization	If the version is managed on the server side and the file is updated beyond the managed version on the server side while the FD desktop is stopped, downlink synchronization of the file fails.
3	Uplink synchronization	When moving a space on the server side, if the space name of the move destination includes the space name to be moved, the files in the folder after the move cannot be up-synchronized.
4	Uplink synchronization	In the case of windows, if you move the folder containing the file by the operation on the client side, only the folder will be up-synchronized to the server side and the files inside will not be synchronized
5	Bidirectional synchronization	If the space is renamed multiple times on the server side and those changes are collectively downloaded and synchronized on the local side, the files in the space may become in a race condition.
6	Icon overlay	Icon overlay is not displayed on macOS 11.2.2 or later
7	Uninstall	Local DB files are not deleted when uninstalling
8	Update	If client A adds or renames a file and the changes are synced to another client B via the server, the file becomes a race condition.
