Functional Improve

No	Functions	Fixes
1	Install	Do not display messages "Windows protected your PC" when running the installer.
2	Conflict Resolution	When the synchronization direction is set to "Downlink synchronization only", allow the local side to discard changes in order to resolve conflicts.
3	Synchronous tree update	The latest tree information can be displayed without having to click the "Re-display Synchronization Tree" button after clicking the "Update Synchronization Tree" button.
4	All	Use on Windows 11 will also be supported.

Bug Fixes

No	Functions	Fixes
1	Downlink synchronization	When the synchronization direction is set to "Downlink synchronization only", if a space is moved from outside the synchronization space to inside the synchronization space on the Fleekdrive side, it will cause an error when it is downlink synchronized.
2	Downlink synchronization	The initial synchronization of Fleekdrive is performed after the initial setup, but if the files and folders to be synchronized are already in the local sync target space before the initial synchronization is completed, the downstream synchronization after the initial synchronization is completed will not be performed properly.
3	Resynchronization	If the resynchronization process of all synchronization spaces is performed before the file move or file rename on the Fleekdrive side is down-synchronized, the file before the move or file rename remains on the local side.
4	Resynchronization	If, in the middle of the resynchronization process of all synchronization spaces, file renaming or file content update in the synchronization space is continuously performed on the Fleekdrive side, the files will be in a state of conflict after the resynchronization process is finished.
5	Downlink synchronization	If multiple operations are performed immediately on the Fleekdrive side, the order of operations may be swapped, which may cause downlink synchronization to not be performed properly.
6	Uplink synchronization	If a space where a file that cannot be deleted on the Fleekdrive side is present is deleted on the local side, other files other than the file that cannot be deleted will be deleted.
7	Downlink synchronization	If the PC information being synchronized is deleted from the synchronization client management in the FD main unit settings during the downlink synchronization process, the synchronization process will stop.
8	Change synchronization folder	When changing the local sync folder from "C:¥XXXXX¥Fleekdrive¥Fleekdrive" to "C:¥XXXXX¥Fleekdrive", an error occurs during the change and the sync folder is lost.
9	Uplink synchronization	When a file/folder is moved locally, it is uplink synchronization as "delete/add".
10	Resynchronization	After resynchronization of all sync spaces, "resolve conflict by merge" from the right-click menu does not reflect the local file on the Fleekdrive side for the conflicting file.
11	Downlink synchronization	If the file is renamed on the Fleekdrive side and a conflict occurs during downstream synchronization, a file with a file name with version information added is downloaded, but with different file contents than on the Fleekdrive side.
12	Downlink synchronization	If a space set as a sync space is a space shared by a partner company, it will not be synchronized by FleekdriveDesktop.
13	Uplink synchronization	After adding a new folder locally and before it is uplink synchronization, if the parent space of the added location is renamed on the Fleekdrive side and it is downlink synchronization, subsequent uplink synchronization is not possible.
14	Uplink synchronization	If you delete My Documents, My Pictures, My Movies, or Shares under My Space on the local side, they will be synchronized upstream and disappear on Fleekdrive as well.
15	Downlink synchronization	When a file is recovered from the Recycle Bin on the Fleekdrive side and the recovered file is in the sync space, there are cases where the file is not synchronized down to the local side.

Bug Fixes

No	Functions	Fixes
16	Downlink synchronization	When moving a space on the Fleekdrive side, if a space with the same name as the target space exists at the destination, subsequent synchronization processes will not work properly, for example, the space that has not been changed will become the target of synchronization.
17	Uplink synchronization	If a file is renamed locally or the contents of a file are updated immediately, there are cases where the file name change is not uplink synchronization and the file name on the Fleekdrive side is not changed.
18	Resynchronization	On the Fleekdrive side, when a space to be synchronized is moved across "My Space", "Collabo Space", and "Compaby Space", the resynchronization process of all synchronized spaces may be executed behind the scenes.
19	Uplink synchronization	If a folder containing files locally is added and an error occurs in upstream synchronization, subsequent uplink synchronization will not be possible.
20	Downlink synchronization	When an error occurs in downlink synchronization, if the error remains unresolved, subsequent downlink synchronization will not be possible.
